Graphene Memory Foam: Material of the future for today's comfort

Graphene is a material formed of pure carbon and is considered the super-material of the future.

The graphene is a carbon layer of an atom of thickness, organized in Hexagon-shaped cells. It is a very hard, flexible and lightweight material that has infinite applications. One of them is to combine it with memory foam. GRAFENO's foam is enriched with graphene to provide better and healthier properties:

Anti-static: Reduces the static load produced by the body in bed.

Temperature control: Dissipates the humidity of the body, which creates a better environment by not accumulating heat during sleep.

Antibacterial: Bacteria do not survive in an environment of graphene.

This modern mattress is upholstered in luxurious super-soft stretch fabric, has designer quilted sides, high density Airdream® core, four horizontal embroidered handles, breathable fabric with anti-mite treatment and CoolAir® 3D fabric for the mattress support area for extra ventilation.
